

The Origin of the Organism

Name: Monmon

Explain these

Type: animal (mammal, fish, bird, reptiles, amphibian) plants

Habitat: forest, sea, desert, explain where they exactly live and how the environment supports their life.

Physical: outer part of their body system characteristic

Morphological: Their inside body system characteristic

Behavioral: eat, move, reproduce, the way they live, etc

Others: special characteristic

Environmental Pressure	Variations by Mutations <i>Make at least 5 variations with different environmental pressure</i>	
As the food supply is getting less and they can only be found at the top of the tree. The organism have to climb higher tree and Monmon have short leg and arms to grab tree.		Name: Monmin Compare to Monmon this species has suitable grabber to stick on the tree trunks, so it helps to climb tree easily <i>Explain clearly about the characteristic and the way they adapt to the environmental pressure (physical, morphological and behavioral adaptations)</i>
Beside the food is getting less, this species have to deal with a predator that hunt them for prey. The predator is stronger, better climber and have ability to see in the dark		Name:
		

The Survival of the Fittest

Name: Monsoner

Explain clearly about the characteristic and the way they adapt to the environment (physical, morphological and behavioral adaptations)

And the reason why they are the survival of the fittest.
